LOGSENSEAI

AI-POWERED LOG ANALYTICS & OBSERVABILITY

Turn raw logs into real-time insight — and let AI agents act on it.

A complete on-premise platform for collecting, searching, understanding and acting on operational data — with a built-in AI copilot and agent connectivity, and without surrendering control of your logs.

10M+	<1s	100%	24/7
EVENTS / MINUTE	STREAMING LATENCY	ON-PREMISE	ANOMALY MONITORING

Modern applications. Legacy systems. AI agents. One operational view.

Pre-built Docker delivery · Online or air-gapped licensing · Your data stays under your control

THE OPERATIONAL CHALLENGE

When systems fail, the answer is buried in fragmented telemetry.

Modern estates combine Kubernetes, containers, APIs and AI workloads with Java and .NET applications, databases, file-based systems and long-lived infrastructure. LogsenseAI brings these signals into one searchable workspace built for operators.

Scattered evidence
Logs are split across hosts, tools and teams, extending investigation time.

Unpredictable SaaS cost
Per-gigabyte pricing grows with data volume while retention becomes a trade-off.

Data sovereignty risk
Sending operational data off-site introduces privacy, policy and compliance concerns.

Alert fatigue
Raw thresholds create noise without context, correlation or useful explanations.

Modern + legacy silos
Cloud-native and traditional systems often need separate monitoring tools.

Slow detection
Teams learn about incidents from users instead of their monitoring platform.

THE LOGSENSEAI APPROACH

Collect. Understand. Detect. Act.

01 COLLECT
Files, syslog, NDJSON, containers, Kubernetes and cloud sources.

02 UNDERSTAND
Auto-parse, enrich, index and correlate every event.

03 DETECT
Built-in ML identifies rare patterns and changing behaviour.

04 ACT
Ask the copilot, alert, and open tickets or page on-call automatically.

New in this release

AI Copilot for guided investigations · Built-in MCP server for Claude, Cursor and custom agents · External tool connections to Slack, Jira, Linear, PagerDuty and GitHub · Full audit trail of every agent action.

CORE PLATFORM

A complete observability cockpit — installed on your infrastructure.

High-throughput ingestion
File tailing with rotation detection, RFC 3164/5424 syslog, bulk NDJSON, Docker, Kubernetes and HTTP collectors.

Always-on offline ML
Isolation Forest, template mining, rare-pattern detection and error-spike analysis run without a GPU or API key.

Flexible AI providers
Configure OpenAI, Anthropic, Gemini, OpenRouter, Ollama or compatible endpoints at runtime — no hardcoded keys.

Alerting with context
Pattern and threshold rules, application scope, severity scoring, deduplication, routing and audit history.

Pluggable monitoring sources
Prometheus, InfluxDB, Elasticsearch, Loki, PostgreSQL, MySQL, AWS CloudWatch and Azure Monitor.

Fast search & live tail
Full-text Log Explorer, structured filters, service mapping and a terminal-style streaming view.

Semantic incident discovery
Local quantized embeddings support meaning-based search and surface similar historical incidents in air-gapped sites.

Optional local LLM edition
A pre-loaded small language model can ship inside the customer bundle for private summaries with no cloud dependency.

LLM & GPU observability
Monitor Ollama, vLLM and DCGM metrics: models, queues, tokens, latency, GPU memory, utilisation, temperature and power.

Log file upload & instant dashboards
Drop in an existing log file in any common format and get a parsed dashboard without wiring up a collector.

Security & governance
JWT role-based access, admin-only account creation, ingest tokens, audit visibility and encrypted LSK1 licensing.

Orchestration ready
One-shot schema migration, liveness and readiness probes, and graceful shutdown for Docker Compose or Kubernetes.

AGENTIC AI

An AI copilot that investigates — and agents that can act.

Ask questions in plain language and get an answer backed by evidence. The copilot runs a transparent tool loop over your own data, and every step it takes is shown so an engineer can verify the reasoning.

In-app investigation copilot

“Why did checkout error at 14:00?” — the copilot searches logs, checks statistics, compares templates, pulls alerts and similar past incidents, then answers with the full tool trace.

Works with any AI provider

The copilot uses whichever provider you configured — cloud vendor, your own endpoint, or the bundled local model for fully offline sites.

Built-in MCP server

Claude Desktop, Cursor, ChatGPT and custom agents connect directly to your deployment over the Model Context Protocol and use the same tools, with the same roles and licence checks.

External tool connections

Connect out to Slack, Jira, Linear, PagerDuty, GitHub or any MCP endpoint so the copilot can open a ticket, page on-call or post an update from inside the investigation.

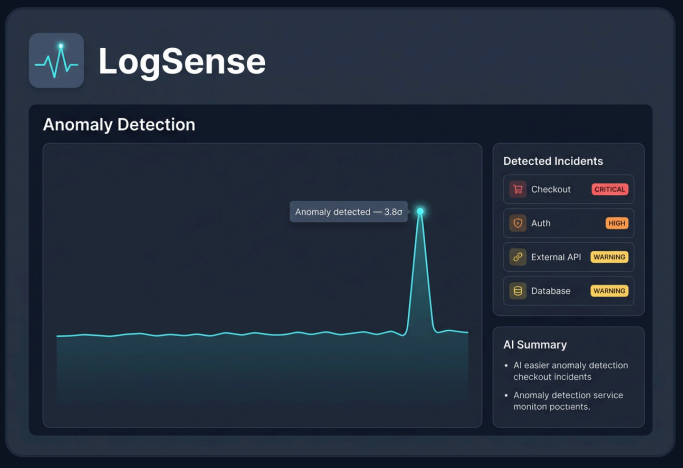

Two-switch action safety

Anything that writes to an external system needs both the connection's “allow actions” setting and a per-conversation toggle — read-only by default.

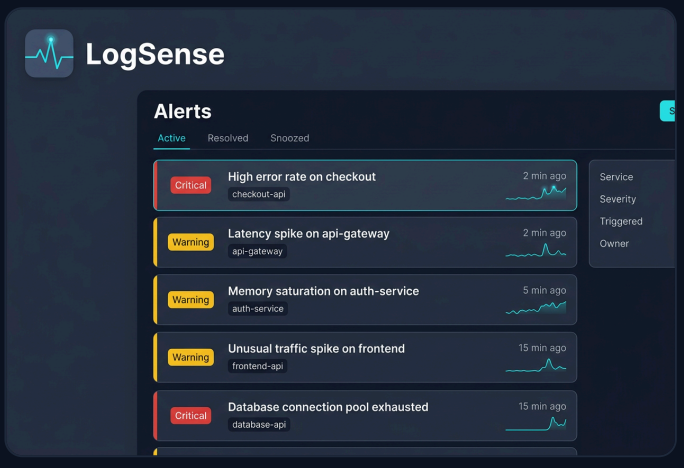

Complete audit trail

Every external tool call is recorded with the user, the tool, its arguments and the outcome. Air-gapped sites simply leave this unconfigured — nothing calls out.

READ-ONLY BY DEFAULT · ROLE-AWARE · LICENCE-GATED

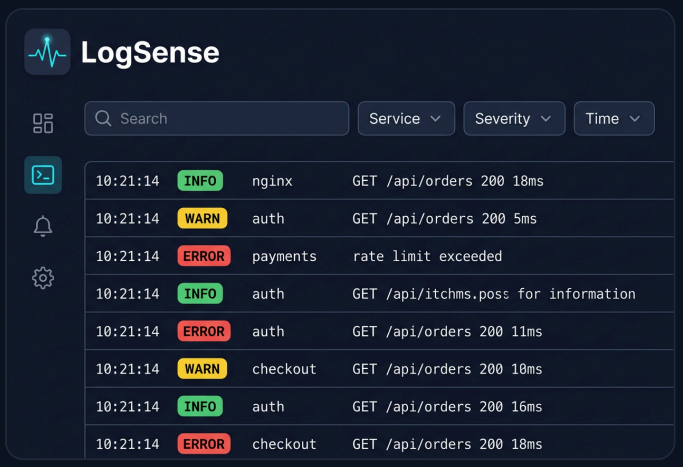

AI Insights
Explainable anomalies, summaries, affected services and similar incidents.

Alerting
Create rules, triage active alerts and cut duplicate noise from one workspace.

OPERATOR EXPERIENCE

Built for fast investigation and clear decisions.

Log Explorer
Filter by application, severity, field and time; inspect raw events beside parsed context.

Dashboards
Track ingestion, errors, latency, applications, infrastructure, users and AI workloads.

DEPLOYMENT, PRIVACY & LICENSING

Your infrastructure. Your data. Your operating model.

LogsenseAI is delivered as pre-built Docker images for installation at each customer site. The customer operates the application and data services; LogsenseAI centrally manages licence issuance without ever receiving customer telemetry.

Self-contained deployment
Frontend, API, worker, PostgreSQL, Redis and Elasticsearch are orchestrated together with health checks and graceful shutdown.

Data stays local
Logs, metrics, configuration and user data remain in the customer-controlled environment.

Built for disconnected sites
Offline ML, local embeddings, optional local LLM and cryptographic licence validation support air-gapped environments.

Online validation
The supplied LSK1 key is verified locally and against the provider's licence service. No log data is sent during validation.

Air-gapped validation
The AES-GCM envelope and RS256 signature are verified locally; validity and expiry are enforced without internet access.

SIMPLE ANNUAL PRICING

Pay per server — never per gigabyte.

Infrastructure, storage, compute and data volume remain the customer's responsibility. Choose the support level required for each licensed server.

BASIC	PROFESSIONAL	PREMIUM
$99 per licence / year • Full on-premise product licence • Updates and standard releases • Documentation and knowledge base • Best-effort email support	**$199** per licence / year • Everything in Basic • 8 support hours / month / licence • Installation and configuration help • Next-business-day email response	**$399** per licence / year • Everything in Professional • 16 support hours / month / licence • Priority remote troubleshooting • Same-business-day response target

Volume discounts: 10+ licences −10% · 25+ licences −15% | Prepaid terms: 2 years −5% · 3 years −10%

SUPPORT POLICY

- Allowance is per licence and pooled across licences on the same order
- Unused monthly support hours do not roll over
- Confirmed product defects do not consume support hours

- Additional support may be purchased separately
- Custom development, integrations and migration are separately quoted
- No hardware, hosting or data-volume fees are included

See your logs differently.

Request a guided demonstration, discuss your deployment topology, or submit a licence request.
